Motivation

Research Question

- Can the common ownership cause stock return comovement ?
 - We connect stocks through the common ownership by blockholders (ownership > 1%)
 - We focus on excess return comovement for a pair of the stocks
 - We use common ownership to forecast cross-sectional variation in the realized correlation of four-factor + industry residuals

Why does it matter?

- Covariance
 - Covariance is a key component of risk in many financial applications.
 (Portfolio selection, Risk management, Hedging and Asset pricing)
 - Covariance is a significant input in risk measurement models (Such as Value-at-Risk)
- Return predictability
 - If it's valid, we can build a profitable buy-sell strategy

Common-ownership measurements

Model based measures

- HJL $_I^A(A,B) = \sum_{i \in I^A,B} \frac{\alpha_{i,B}}{\alpha_{i,A} + \alpha_{i,B}}$ Harford et al. (2011)
- $\bullet \ \ \mathsf{Top5}_j = \frac{1}{n-1} \sum_i^5 \sum_{j \neq k} \nu_{ik}$ Antón et al. (2020)
- $\kappa_{ij} = \cos(\nu_i, \nu_j) \cdot \sqrt{\frac{IHHI_j}{IHHI_i}}$ Backus et al. (2020)
- $\mathsf{GGL}^A(A,B) = \sum_{i=1}^I \alpha_{i,A} g(\beta_{i,A}) \alpha_{i,B}$ Gilje et al. (2020), Lewellen and Lewellen (2021)
- MHHI_{Delta} = $\sum_{j=1}^{J} \sum_{k\neq j}^{K} \frac{\sum_{i=1}^{N} w_j * w_k * \mu_{i,j} * \mu_{i,k}}{\sum_{i=1}^{N} \mu_{i,j} * \mu_{i,k}}$ Lewellen and Lowry (2021)

Common-ownership measurements

Model based measures

- HJL $_I^A(A,B) = \sum_{i \in I^A,B} \frac{\alpha_{i,B}}{\alpha_{i,A} + \alpha_{i,B}}$ Harford et al. (2011)
- lacktriangledown $\operatorname{Top5}_j = rac{1}{n-1} \sum_i^5 \sum_{j
 eq k}
 u_{ik}$ Antón et al. (2020)
- $\kappa_{ij} = \cos(\nu_i, \nu_j) \cdot \sqrt{\frac{IHHI_j}{IHHI_i}}$ Backus et al. (2020)
- $\mathsf{GGL}^A(A,B) = \sum_{i=1}^I \alpha_{i,A} \mathsf{g}(\beta_{i,A}) \alpha_{i,B}$ Gilje et al. (2020) , Lewellen and Lewellen (2021)
- MHHI_{Delta} = $\sum_{j=1}^{J} \sum_{k \neq j}^{K} \frac{\sum_{i=1}^{N} w_j * w_k * \mu_{i,j} * \mu_{i,k}}{\sum_{i=1}^{N} \mu_{i,j} * \mu_{i,k}}$ Lewellen and Lowry (2021)

Ad-hoc measures

- Overlap_{AP}(A, B) = $\sum_{i \in I^{A,B}} \alpha_{i,A} \frac{\bar{\nu}_{A}}{\bar{\nu}_{A} + \bar{\nu}_{B}} + \alpha_{i,B} \frac{\bar{\nu}_{B}}{\bar{\nu}_{A} + \bar{\nu}_{B}}$ Anton and Polk (2014)
- Overlap $Count}(A, B) = \sum_{i \in I^A, B} 1$ He and Huang (2017), He et al. (2019)
- Overlap_{Min}(A, B) = $\sum_{i \in I^{A,B}} \min\{\alpha_{i,A}, \alpha_{i,B}\}$ Newham et al. (2018)
- Overlap_{HL} $(A, B) = \sum_{i \in I^{A,B}} \alpha_{i,A} \times \sum_{i \in I^{A,B}} \alpha_{i,B}$ Hansen and Lott Jr (1996) , Freeman (2019)

Common-ownership measurements

Model based measures

- HJL $_I^A(A,B) = \sum_{i \in I^A,B} \frac{\alpha_{i,B}}{\alpha_{i,A} + \alpha_{i,B}}$ Harford et al. (2011)
- $\bullet \quad \mathsf{Top5}_j = \tfrac{1}{n-1} \sum_i^5 \sum_{j \neq k} \nu_{ik}$ Antón et al. (2020)
- $\kappa_{ij} = \cos(\nu_i, \nu_j) \cdot \sqrt{\frac{IHHI_j}{IHHI_i}}$ Backus et al. (2020)
- GGL^A(A, B) = $\sum_{i=1}^{I} \alpha_{i,A} g(\beta_{i,A}) \alpha_{i,B}$ Gilje et al. (2020), Lewellen and Lewellen (2021)
- MHHI_{Delta} = $\sum_{j=1}^{J} \sum_{k \neq j}^{K} \frac{\sum_{i=1}^{N} w_{j} * w_{k} * \mu_{i,j} * \mu_{i,k}}{\sum_{i=1}^{N} \mu_{i,j} * \mu_{i,k}}$ Lewellen and Lowry (2021)

Ad-hoc measures

- Overlap_{AP}(A, B) = $\sum_{i \in I^{A,B}} \alpha_{i,A} \frac{\bar{\nu}_{A}}{\bar{\nu}_{A} + \bar{\nu}_{B}} + \alpha_{i,B} \frac{\bar{\nu}_{B}}{\bar{\nu}_{A} + \bar{\nu}_{B}}$ Anton and Polk (2014)
- Overlap_{Count} $(A, B) = \sum_{i \in I^{A,B}} 1$ He and Huang (2017), He et al. (2019)
- Overlap_{Min}(A, B) = $\sum_{i \in I^{A,B}} \min\{\alpha_{i,A}, \alpha_{i,B}\}$ Newham et al. (2018)
- Overlap_{HL} $(A, B) = \sum_{i \in I^{A,B}} \alpha_{i,A} \times \sum_{i \in I^{A,B}} \alpha_{i,B}$ Hansen and Lott Jr (1996) , Freeman (2019)

Selected measure

We need a pair-level measure, which is bi-directional, so we use the AP measure.

Comparison

Comparison of two methods for calculating common ownership

Conclusion

We use the SQRT measure because it has an acceptable variation and has fair values at a lower level of aggregate common ownership.

Correlation Calculation

4 Factor + Industry

Frist Step:

Estimate each of these models on periods of three month:

• CAPM + Industry (2 Factor):

$$R_{i,t} = \alpha_i + \beta_{mkt,i} R_{M,t} + \beta_{Ind,i} R_{Ind,t} + \boxed{\varepsilon_{i,t}}$$

• 4 Factor :

$$\begin{split} R_{i,t} &= \alpha_i + \beta_{\textit{mkt},i} R_{\textit{M},t} + \\ &+ \beta_{\textit{HML},i} \textit{HML}_t + \beta_{\textit{SMB},i} \textit{SMB}_t + \beta_{\textit{UMD},i} \textit{UMD}_t + \boxed{\varepsilon_{i,t}} \end{split}$$

• 4 Factor + Industry (5 Factor) :

$$\begin{split} R_{i,t} &= \alpha_i + \beta_{\textit{mkt},i} R_{\textit{M},t} + \beta_{\textit{Ind},i} R_{\textit{Ind},t} \\ &+ \beta_{\textit{HML},i} \textit{HML}_t + \beta_{\textit{SMB},i} \textit{SMB}_t + \beta_{\textit{UMD},i} \textit{UMD}_t + \boxed{\varepsilon_{i,t}} \end{split}$$

 Second Step: Calculate monthly correlation of each stock pair's daily abnormal returns (residuals)

Correlation Calculation Results

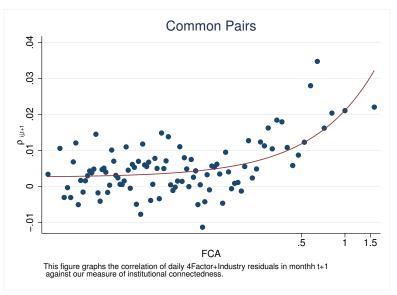

Factors	mean	std	min	max
SMB	0.19	1.47	-5.64	19.52
HML	-0.12	1.39	-4.90	23.20
Winner – Loser	0.69	1.06	-2.61	8.58
Market	0.24	1.23	-4.71	4.89

$\rho_{ij,t}$	mean	std	min	25%	50%	75%	max
CAPM + Industry	0.01	0.33	-1	-0.194	0.006	0.208	1
4 Factor	0.04	0.34	-1	-0.172	0.035	0.249	1
4 Factor + Industry	0.01	0.33	-1	-0.194	0.005	0.206	1
4 Factor $+$ Industry (With Lag)	0.01	0.32	-1	-0.194	0.006	0.206	1

Conclusion

We use the 4 Factor + Industry model to control for exposure to systematic risk because it almost captures all correlations between two firms in each pair.

Future Correlation via FCA

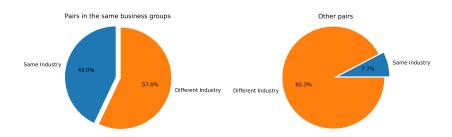

Controls

- $oldsymbol{
 ho}_t$: Current period correlation
- **SameGroup**: Dummy variable for whether the two stocks belong to the same business group.
- **SameIndustry**: Dummy variable for whether the two stocks belong to the same Industry.
- SameSize: The negative of absolute difference in percentile ranking of size across a pair
- SameBookToMarket :The negative of absolute difference in percentile ranking of the book to market ratio across a pair
- CrossOwnership: The maximum percent of cross-ownership between two firms

Fama-MacBeth Estimation

- Fama-MacBeth regression analysis is implemented using a two-step procedure.
 - The first step is to run periodic cross-sectional regression for dependent variables using data of each period.
 - The second step is to analyze the time series of each regression coefficient to determine whether the average coefficient differs from zero.

Fama-MacBeth (1973)

- Two Step Regression
 - First Step

$$Y_{i1} = \delta_{0,1} + \delta_{1,1}^{1} X_{i,1}^{1} + \dots + \delta_{k,1}^{k} X_{i,1}^{k} + \varepsilon_{i,1}$$

$$\vdots$$

$$Y_{iT} = \delta_{0,1} + \delta_{1,T}^{1} X_{i,T}^{1} + \dots + \delta_{k,T}^{k} X_{i,T}^{k} + \varepsilon_{i,T}$$

Second Step

$$\begin{bmatrix} \bar{Y}_1 \\ \vdots \\ \bar{Y}_T \end{bmatrix}_{T \times 1} = \begin{bmatrix} 1 & \delta_1^0 & \delta_1^1 & \dots & \delta_1^k \\ \vdots & \vdots & \vdots & \dots & \vdots \\ 1 & \delta_T^0 & \delta_T^1 & \dots & \delta_T^k \end{bmatrix}_{T \times (k+2)} \times \begin{bmatrix} \lambda \\ \lambda_0 \\ \lambda_1 \\ \vdots \\ \lambda_k \end{bmatrix}_{(k+2) \times 1}$$

• Fama-MacBeth technique was developed to account for correlation between observations on different firms in the same period

Calculating standard errors

- In most cases, the standard errors are adjusted following Newey and West (1987).
 - Newey and West (1987) adjustment to the results of the regression produces a new standard error for the estimated mean that is adjusted for autocorrelation and heteroscedasticity.
 - Only input is the number of lags to use when performing the adjustment

$$Lag = 4(T/100)^{\frac{2}{9}}$$

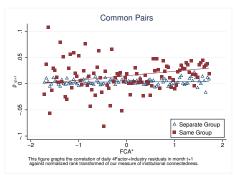

where T is the number of periods in the time series

Future Correlation via FCA

Normalized Rank-Transformed

Estimation model

Use Fama-MacBeth to estimate this model

$$\begin{split} \rho_{ij,t+1} &= \beta_0 + \beta_1 * \mathsf{FCA}^*_{ij,t} + \beta_2 * \mathsf{SameGroup}_{ij} \\ &+ \beta_3 * \mathsf{FCA}^*_{ij,t} \times \mathsf{SameGroup}_{ij} \\ &+ \sum_{k=1}^n \alpha_k * \mathsf{Control}_{ij,t} + \varepsilon_{ij,t+1} \end{split} \tag{1}$$

- Estimate the model on a monthly frequency
- Adjust standard errors by Newey and West adjustment with 4 lags $(4(60/100)^{\frac{2}{9}}=3.57\sim4)$

Conclusion

- We derive a measure that captures the extent of common ownership distribution.
- The common ownership comovement effect with a extra explanation:
 - Common ownership that crosses a threshold affect on comovement
 - Be in the same business group has a major effect on comovement

Table of Contents

Appendix I

- 10 Appendix I
 - Synchronicity and firm interlocks
 - Large controlling shareholder and stock price synchronicity
 - Connected Stocks
 - Measures' Detail

Measuring Common Ownership

- If two stocks in pair have n mutual owner, which total market cap divides them equally, the mentioned indexes equal n.
 - Each holder owns 1/n of each firm.
 - Firm's market cap is α_1 and α_2 :
 - So for each holder of firms we have $S_{i,t}^f P_{i,t} = \alpha_i$
 - SQRT

$$\left[\frac{\sum_{f=1}^{n} \sqrt{\alpha_1/n} + \sum_{f=1}^{n} \sqrt{\alpha_2/n}}{\sqrt{\alpha_1} + \sqrt{\alpha_2}}\right]^2 = \left[\frac{\sqrt{n}(\sqrt{\alpha_1} + \sqrt{\alpha_2})}{\sqrt{\alpha_1} + \sqrt{\alpha_2}}\right]^2 = n$$

Quadratic

$$\left[\frac{\sum_{f=1}^{n} (\alpha_1/n)^2 + \sum_{f=1}^{n} (\alpha_2/n)^2}{\alpha_1^2 + \alpha_2^2}\right]^{-1} = \left[\frac{\alpha_1^2 + \alpha_2^2}{n(\alpha_1^2 + \alpha_2^2)}\right]^{-1} = n$$

2/9

Table of Contents

9 Appendix

- 10 Appendix II
 - Synchronicity and firm interlocks
 - Large controlling shareholder and stock price synchronicity
 - Connected Stocks
 - Measures' Detail

Main Effect

Common-ownership and comovement effect

[Anton and Polk (2014)]

Stocks sharing many common investors tend to comove more strongly with each other in the future than otherwise similar stocks.

• Common-ownership and liquidity demand

[Koch et al. (2016), Pastor and Stambaugh (2003), Acharya and Pedersen (2005)] Commonality in stock liquidity is likely driven by correlated trading among a given stock's investors. Commonality in liquidity is important because it can influence expected returns

• Trading needs and comovement

[Greenwood and Thesmar (2011)]

If the investors of mutual funds have correlated trading needs, the stocks that are held by mutual funds can comove even without any portfolio overlap of the funds themselves

Stock price synchronicity and poor corporate governance

[Boubaker et al. (2014), Khanna and Thomas (2009), Morck et al. (2000)] Stock price synchronicity has been attributed to poor corporate governance and a lack of firm-level transparency. On the other hand, better law protection encourages informed trading, which facilitates the incorporation of firm-specific information into stock prices, leading to lower synchronicity

Synchronicity and firm interlocks

JFE-2009-Khanna

- Three types of network
 - Equity network
 - 2 Director network
 - Owner network
- Dependent variables

Using deterended weekly return for calculation

- **1** Pairwise returns synchronicity = $\frac{\sum_{\mathbf{t}} (n_{i,j,\mathbf{t}}^{i,j,\mathbf{t}}, n_{i,j,\mathbf{t}}^{down})}{T_{i,j}}$
- 2 Correlation = $\frac{Cov(i,j)}{\sqrt{Var(i).Var(j)}}$
- Tobit estimation of

$$f_{i,j}^d = \alpha I_{i,j} + \beta (1 * N_{i,j}) + \gamma Ind_{i,j} + \varepsilon_{i,j}$$

being in the same director network has a significant effect

Large controlling shareholder and stock price synchronicity JBF-2014-Boubaker

Stock price synchronicity:

$$SYNCH = \log(\frac{R_{i,t}^2}{1 - R_{i,t}^2})$$

where $R_{i,t}^2$ is the R-squared value from

$$RET_{i,w} = \alpha + \beta_1 MKRET_{w-1} + \beta_2 MKRET_w + \beta_3 INDRET_{i,w-1} + \beta_4 INDRET_{i,w} + \varepsilon_{i,w}$$

OLS estimation of

$$\begin{aligned} \textit{SYNCH}_{i,t} &= \beta_0 + \beta_1 \textit{Excess}_{i,t} + \beta_2 \textit{UCF}_{i,t} + \sum_k \beta_k \textit{Control}_{i,t}^k \\ &+ \textit{IndustryDummies} + \textit{YearDummies} + \varepsilon_{i,t} \end{aligned}$$

- + industry Duminies + rear Duminies + $\varepsilon_{i,t}$
- Firms with substantial excess control are more likely to experience stock price crashes

Stock price synchronicity increases with excess control

- Common active mutual fund owners
- Measuring Common Ownership

•
$$FCAP_{ij,t} = \frac{\sum_{f=1}^{F} (S_{i,t}^{f} P_{i,t} + S_{j,t}^{f} P_{j,t})}{S_{i,t}P_{i,t} + S_{j,t}P_{j,t}}$$

- ullet Using normalized rank-transformed as $FCAP_{ij,t}^*$
- $\rho_{ij,t}$: within-month realized correlation of each stock pair's daily four-factor returns

0

$$ho_{ij,t+1} = a + b_f \times FCAPF_{ij,t}^* + \sum_{k=1}^{n} CONTROL_{ij,t,k} + \varepsilon_{ij,t+1}$$

Estimate these regressions monthly and report the time-series average as in Fama-MacBeth

Commonownership measurements

Model-based measures

•
$$\mathsf{HJL}^A_I(A,B) = \sum_{i \in I^A,B} \frac{\alpha_{i,B}}{\alpha_{i,A} + \alpha_{i,B}}$$
 Harford et al. (2011)

- Bi-directional
- Pair-level measure of common ownership
- Its potential impact on managerial incentives
- Measure not necessarily increases when the relative ownership increases
- Accounts only for an investor's relative holdings

$$\bullet \ \ \mathsf{MHHI} = \textstyle \sum_{j} \sum_{k} \mathsf{s}_{j} \mathsf{s}_{k} \frac{\sum_{i} \mu_{ij} \nu_{ik}}{\sum_{i} \mu_{ij} \nu_{ij}} \ \ \mathsf{Azar} \ \mathsf{et} \ \mathsf{al.} \ \mathsf{(2018)}$$

- Capture a specific type of externality
- Measured at the industry level
- Assumes that investors are fully informed about the externalities
- $\operatorname{\mathsf{GGL}}^A(A,B) = \sum_{i=1}^I \alpha_{i,A} g(\beta_{i,A}) \alpha_{i,B}$ Gilje et al. (2020)
 - Bi-directional
 - Less information
 - Not sensitive to the scope
 - Measure increases when the relative ownership of firm A increases

8/9

Commonownership measurements

Ad hoc common ownership measures

- $Overlap_{Count}(A, B) = \sum_{i \in I^{A,B}} 1$ He and Huang (2017),He et al. (2019)
- $Overlap_{Min}(A,B) = \sum_{i \in I^{A,B}} min\{\alpha_{i,A},\alpha_{i,B}\}$ Newham et al. (2018)
- Overlap_{AP}(A,B) = $\sum_{i \in I^{A,B}} \alpha_{i,A} \frac{\bar{\nu}_A}{\bar{\nu}_A + \bar{\nu}_B} + \alpha_{i,B} \frac{\bar{\nu}_B}{\bar{\nu}_A + \bar{\nu}_B}$ Anton and Polk (2014)
- $Overlap_{HL}(A,B) = \sum_{i \in I^{A,B}} \alpha_{i,A} \times \sum_{i \in I^{A,B}} \alpha_{i,B}$ Hansen and Lott Jr (1996) , Freeman (2019)
- Unappealing properties
 - Unclear is whether any of these measures represents an economically meaningful measure of common ownership's impact on managerial incentives.
 - Both Overlap_{Count} and Overlap_{AP} are invariant to the decomposition of ownership between the two firms, which leads to some unappealing properties.

9/9
